PropMv Backend — GitHub Owner/Admin Setup
DO THIS NOW ONLY

Scope: prepare GitHub for the first backend staging deployment. Do not configure production yet.

1. Create the staging Environment

Go to: Repository → Settings → Environments → New environment → create exactly **staging**.

Add these 5 Environment secrets:

Secret	Value
STAGING_EC2_HOST	test1 107.20.112.16
STAGING_EC2_USER	ubuntu
STAGING_EC2_SSH_KEY	Testing EC2 private SSH key
STAGING_EC2_SSH_PORT	22
STAGING_BACKEND_APP_DIR	/home/ubuntu/propmv

Test 2

Important: enter the SSH private key only into the GitHub secret field. Do not send or paste the key into chat.

2. Check STAGING_FROM_EMAIL

12/09/2026

Go to: Repository → Settings → Secrets and variables → Actions → Repository secrets

- Check whether **STAGING_FROM_EMAIL** already exists.
- Do not reveal or copy its value.
- If it exists: leave it unchanged.
- If it does not exist: STOP and tell Akash before creating anything. The current smoke-test job does not declare the staging Environment, so this needs a workflow decision first.

3. Do NOT do these things now

- Do not create the production Environment.
- Do not add any PRODUCTION_* secrets.
- Do not change the backend workflow.
- Do not push or merge development → staging yet.
- Do not run the production workflow.
- Do not change EC2 configuration.

4. What to report back

■ staging Environment created: YES/NO
■ All 5 staging secrets added: YES/NO
■ STAGING_FROM_EMAIL already exists as a repository secret: YES/NO
■ Any error or unexpected GitHub setting encountered.

After these items are completed, STOP. Do not merge or deploy. The next step will be a read-only preflight of the Testing EC2.
